# ABSTRACT

---

In an image classification task, the network assigns a label (or class) to each input image. However, suppose you want to know the shape of that object, which pixel belongs to which object, etc. In this case, you need to assign a class to each pixel of the image—this task is known as segmentation. A segmentation model returns much more detailed information about the image. Image segmentation has many applications in medical imaging, self-driving cars and satellite imaging, just to name a few.

# DATASET

Images for segmentation of optical coherence tomography images with diabetic macular edema.

One with diabetic macular edema

# DATASET

---

Contains 10 MATLAB files for 10 Subjects

Each MATLAB file contains :

61 retina images , and their manually segmented diabetic edema part of the fluid layer, and automatically segmented images using DME

*We have trained our model on just the images, and segmented it.*

# DATASET

Image[25]

*ManualFluid1[25]*

# MODEL USED

## UNET

# HYPERPARAMETERS

---

BATCH\_SIZE = 64

EPOCHS = 1000

THRESHOLD = 0.3

LEARNING\_RATE = 0.005

MOMENTUM = 0.99

LOSS FUNCTION = CROSS ENTROPY LOSS

OPTIMIZER = SGD

# RESULTS

Image

Segmented Image

Segmented Image  
with Localization

# FUTURE SCOPES

USING DIFFERENT MODELS LIKE  
DEEPLAB AND MASKRCNN

PREPROCESSING THE  
IMAGE , BEFORE GIVING  
INPUTS TO THE MODEL

BUILDING A BINARY CLASSIFIER TO  
ACTUALLY PREDICT WHETHER A PERSON  
HAS DIABETIC MACULAR EDEMA
